OR/M Code Challenge

Using React , GraphQl and your choice of GraphQl client (we use Relay but you are no required), create an API from which you can query from to display books. We have a attached a JSON file of 100 books to use. The user should be able to display 10 books initially, paginate through the books and also perform a fuzzy search. The books should display in a grid format. When complete please push your code to a Github repo and provide Open Road Media with a link. We encourage you to complete as many of the criteria as possible.

Acceptance Criteria

Display 10 books at a time.
Allow the user to paginate through the books
Allow the user to search through the books by title
Style the grid and layout

Bonus Criteria (optional)

Create units tests for created components.
Allow the user to click into an individual book page and display more details

Note

If you don't have experience with GraphQL, feel free to build API using Node.JS and use it in React Components.
